Dear Ana, dear Raul,

Please find hereafter two comments / clarification propositions regarding the SRGI public consultation on OSBB :

- In this proposal, the oversubscription is made on an IP where technical capacities are equal at each border but it is not the case for all IP. We don't think that the bundle of additional capacities could work because each TSO will not have the same amount to offer at the same gas day D. In addition, a TSO may need to buy back but not the other.
- To buy back, you suggest to use the Secondary Market on PRISMA with Call For Order method, but the Secondary Market is not dynamic. The vast majority of trade is made with OTC method and the platform is use only to inform the TSO and register the trade. It will be useful to inform the market when a trade proposal for buy back is made on the platform. On the platform there is another functionality named Reverse Auction which is on the Primary Market. This functionality could have been used in your proposal.

Best regards,

Claude MANGIN
